

A 3D rendering of a cell with numerous receptors on its surface. Several green, Y-shaped structures, representing antibodies, are bound to these receptors. The cell is shown in a light blue/white color, while the background is a dark blue gradient. The overall image has a scientific and medical feel.

CORPORATE PRESENTATION

JUNE 2020

PDS Biotechnology

*A new generation of multi-functional
cancer immunotherapies*

Frank Bedu-Addo Ph.D. President & CEO

Forward-Looking Statements

This presentation contains forward-looking statements about PDS Biotechnology Corporation (“PDSB”), and its businesses, business prospects, strategies and plans, including but not limited to statements regarding anticipated pre-clinical and clinical drug development activities and timelines and market opportunities. All statements other than statements of historical facts included in this presentation are forward-looking statements. The words “anticipates,” “may,” “can,” “plans,” “believes,” “estimates,” “expects,” “projects,” “intends,” “likely,” “will,” “should,” “to be,” and any similar expressions or other words of similar meaning are intended to identify those assertions as forward-looking statements. These forward-looking statements involve substantial risks and uncertainties that could cause actual results to differ materially from those anticipated.

Factors that may cause actual results to differ materially from such forward-looking statements include those identified under the caption “Risk Factors” in the documents filed with the Securities and Exchange Commission from time to time, including its Annual Reports on Form 10-K, Quarterly Reports on Form 10-Q and Current Reports on Form 8-K. You are cautioned not to place undue reliance on these forward-looking statements, which speak only as of the date of this presentation. Except to the extent required by applicable law or regulation, PDSB undertakes no obligation to update the forward-looking statements included in this presentation to reflect subsequent events or circumstances.

PDS Biotechnology leadership team has demonstrated success in the development and commercialization of leading pharmaceutical products

■ Frank Bedu-Addo, PhD Chief Executive Officer

- Senior executive experience with management of strategy and execution at both large pharma and biotechs
- Notable drug development:
 - Abelcet[®] (Liposome Company/ Elan)
 - PEG-Intron[®] (Schering-Plough/ Merck)

■ Lauren V. Wood, MD Chief Medical Officer

- >30 years of translational clinical research experience
- Former Director of Clinical Research at the National Cancer Institute Center for Cancer Research (Cancer Vaccine Branch)

■ Gregory Conn, PhD Chief Scientific Officer

- Co-founder
- >35 years of drug development experience
- In-depth experience with biotech drug discovery, product development and manufacturing

PDS Biotech is well-poised to transform vaccines and cancer treatment by fulfilling the promise of immunotherapy

1

Powerful immunotherapy platform that activates therapeutic and preventive immunological pathways

2

Demonstrated potential for strong clinical efficacy and durability of response with minimal toxicity

3

Diversified pipeline focused on oncology and infectious disease

4

Clinical studies in areas of high unmet medical need supported by leaders in the field

PDS Biotech is a clinical stage biotechnology company developing a pipeline of immunotherapies based on the proprietary Versamune[®] platform

CORPORATE OVERVIEW

- Publicly listed on NASDAQ: PDSB
- ~15 employees with headquarters in Princeton, NJ
- 15.3M shares outstanding with \$21.0M in cash*

VERSAMUNE[®] PLATFORM

- Versatile and potent T-cell-activating platform
- Clinically validated induction of active antigen-specific killer helper T-cells as well as antibodies *in vivo*
- Promising clinical efficacy in early trials of PDS0101 monotherapy with good safety and no dose limiting toxicities

PIPELINE

Oncology

- **PDS0101 (Phase 2)**: HPV-associated cancers
- **PDS0102**: Prostate, breast cancers
- **PDS0103**: Ovarian, breast, colorectal and lung cancers
- **PDS0104**: Melanoma

Infectious Disease

- **PDS0201**: Tuberculosis vaccine
- **PDS0202**: Universal influenza vaccine
- **PDS0203**: COVID-19 vaccine

A 3D molecular model of a protein surface, rendered in a light blue/teal color. The surface is highly textured and irregular. Several smaller, darker teal molecular structures are scattered around the main protein, representing ligands or interacting molecules. The background is a dark, gradient blue.

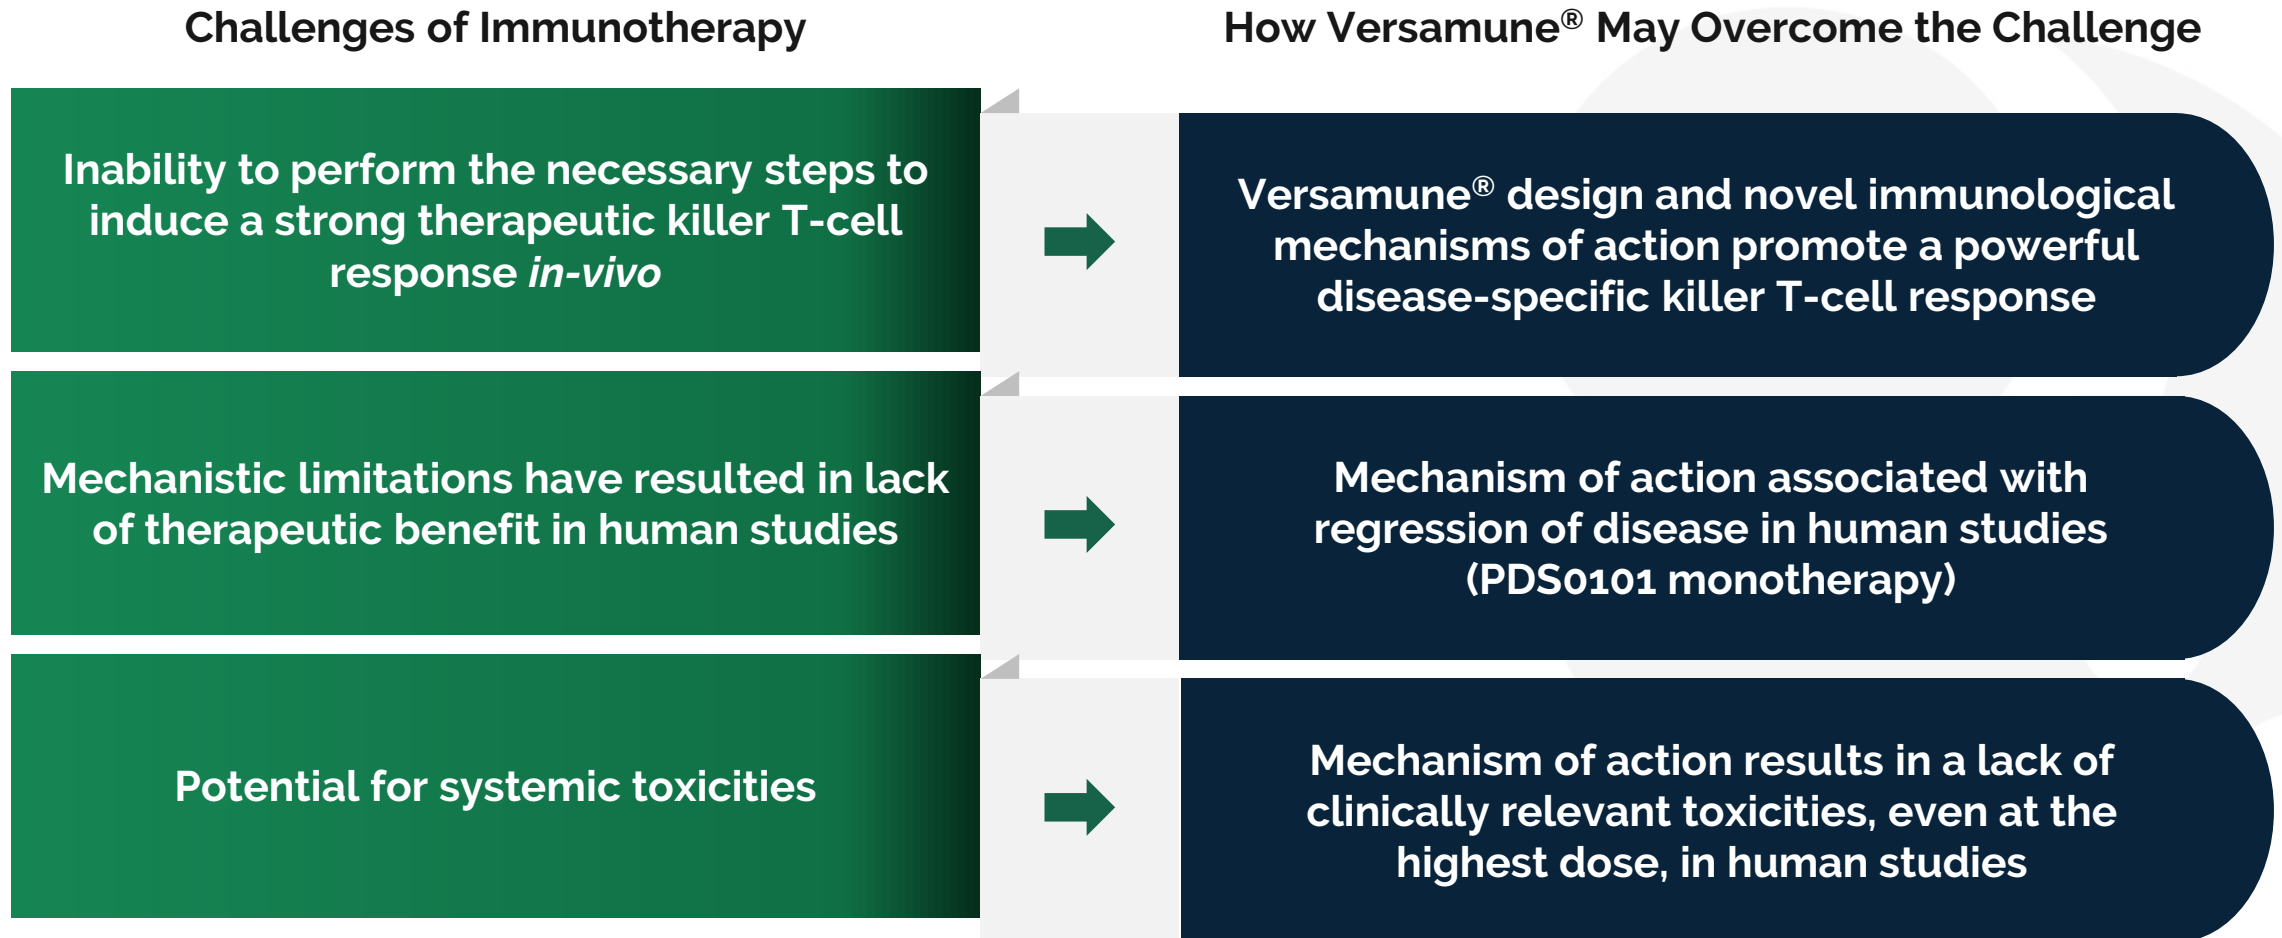

Versamune® Platform

Versamune[®] is a proprietary T-cell activating platform engineered to induce a robust, targeted anti-tumor response *in vivo*

- Versamune[®] is based on proprietary, positively charged and immune activating lipids that form spherical nanoparticles in aqueous media
- The nanoparticles are sized to mimic viruses, which promotes excellent uptake by dendritic cells of the immune system
- Activates the important Type I interferon immunological signaling pathway
- Versamune[®] promotes the activation and maturation of dendritic cells, which then migrate to the lymph nodes

Versamune® has demonstrated the potential to overcome the challenges of immunotherapy in oncology and infectious disease

Greater quantity and quality of Versamune[®]-induced killer T-cells may result in unique ability to eradicate HPV-positive tumors after a single dose

Produces > 10-fold number of highly potent (polyfunctional) killer T-cells vs. other T-cell technologies

The combination of Versamune® and a proprietary antigen is engineered for simplicity and ease of administration

Vials of HPV16 mix (L)
and Versamune® (R)

Versamune® formulation
is mixed before injection*

Delivered via
subcutaneous injection

A 3D visualization of a cell surface. The central part is a large, textured, light blue structure with many small protrusions. Several smaller, green, Y-shaped structures are scattered around it, some appearing to be attached to the surface. The background is a dark blue gradient.

Oncology

PDS Biotech's immuno-oncology pipeline combines the Versamune® platform with proprietary tumor antigens across several cancer types

PRODUCT	INDICATION	COMBINATION	PC	P1	P2	P3	R	PARTNER(S)	
Oncology									
<u>PDS0101</u> <u>(HPV16)</u>	First line treatment of recurrent / metastatic head and neck cancer	KEYTRUDA®	PDS Biotech Funded						MERCK
<u>PDS0101</u> <u>(HPV16)</u>	Advanced HPV-associated malignancies	M7824 NHS-IL12	Partner Co-Funded						NIH NATIONAL CANCER INSTITUTE
<u>PDS0101</u> <u>(HPV16)</u>	Stage IIb-IVa cervical cancer	Chemo-radiation	Partner Co-Funded						THE UNIVERSITY OF TEXAS MD Anderson Cancer Center
<u>PDS0102</u> <u>(TARP)</u>	Prostate and breast cancer	Immunotherapy	PDS Biotech Funded						NIH NATIONAL CANCER INSTITUTE
<u>PDS0103</u> <u>(MUC-1)</u>	Breast, colorectal, ovarian and NSCLC cancer	Immunotherapy	PDS Biotech Funded						NIH NATIONAL CANCER INSTITUTE
<u>PDS0104</u> <u>(TRP2)</u>	Melanoma	Immunotherapy	PDS Biotech Funded						

PDS Biotech Funded  Partner Co-Funded 

PDS0101 is designed to treat cancers caused by human papillomavirus (HPV)

Approximately 43,000 patients are diagnosed with HPV-associated cancers each year, a number unlikely to be impacted by increased use of HPV preventive vaccines in the next decade

- **Oropharyngeal (head & neck) cancers**
 - >18,000 cases annually
 - Most common HPV-cancer in men, **90% of cases are HPV16-specific**
 - **Incidence increasing**
- **Cervical cancer**
 - ~12,000 cases annually
 - Most common HPV-cancer in women, 50-60% of cases are HPV16-specific
 - Incidence steady
- **Initial market research suggests market penetration of ~20% is reasonable for PDS0101**

PDS0101 combines the utility of the Versamune® platform with a proprietary mix of HPV16 antigens, the most virulent high-risk HPV type and by far the most prevalent in patients with HPV-associated cancer

PDS0101 Phase 1 clinical trial: Unique *in vivo* demonstration of high levels of HPV-specific killer T-cells in circulating blood

Clinical study results successfully demonstrate translation of Versamune[®]'s multi-functional mechanism of action between pre-clinical models and humans

Clinical Study Results in Patients with CIN

- Immunogenicity at Day 14
- Defined dose for Phase 2 studies (3mg)
- No dose-limiting toxicities

Follow-up of patients in PDS0101 Phase 1 study demonstrated promising clinical responses at all three tested doses

- A post-hoc, retrospective analysis, demonstrated complete lesion regression in at least 60% of evaluable patients (6/10) as early as 1-3 months after treatment
 - No lesion recurrence occurred within the 2-year evaluation period
- Spontaneous regression of CIN1 occurs in about 44% of patients over a 2-year duration*
- These results were remarkably positive as most patients were infected with multiple high-risk HPV types
- Two patients who had regression by cytology were not considered clinical responders:
 - The first regressed to atypical cells of undetermined significance at the first post-treatment evaluation (3 months) but HPV detected
 - The second had complete regression by cytology at the first post-treatment evaluation (3 months) but had residual CIN by colposcopy

PDS Biotech clinical strategy in advanced cancer is to focus on efficiency and risk mitigation to proof of concept

Versamune[®]-based immunotherapies are being developed as combination therapies to exploit the demonstrated synergies between Versamune[®] and other anti-cancer agents

- Checkpoint inhibitors have shown confirmed clinical efficacy and have demonstrated clinical benefit in late stage cancer
 - Checkpoint inhibitors block a key immunological defense mechanism for cancer cells, and are reported to work primarily in patients whose immune systems are already generating tumor-attacking CD8+ killer T-cells pre-treatment
- Using various tumor-specific proteins (antigens), Versamune[®] has demonstrated the unique ability to generate large and superior numbers of CD8+ killer T-cells that effectively recognize and kill antigen-expressing cancer cells in pre-clinical and human clinical studies

PDS Biotech is developing a new generation of advanced cancer treatments combining Versamune[®]-based immunotherapies with checkpoint inhibitors and other standard of care therapies

The robust T-cell response induced by Versamune[®] results in the potential for enhancement of efficacy of checkpoint inhibitors in immune suppressive B16 melanoma

Early clinical studies showed the checkpoint inhibitor to be ineffective in treating B16 melanoma, a notoriously difficult model to treat.

Versamune[®] + TRP2 melanoma antigen (sub-optimal levels) promotes infiltration of active killer T-cells into tumors, strong synergy with the checkpoint inhibitor, and significantly enhanced anti-tumor efficacy

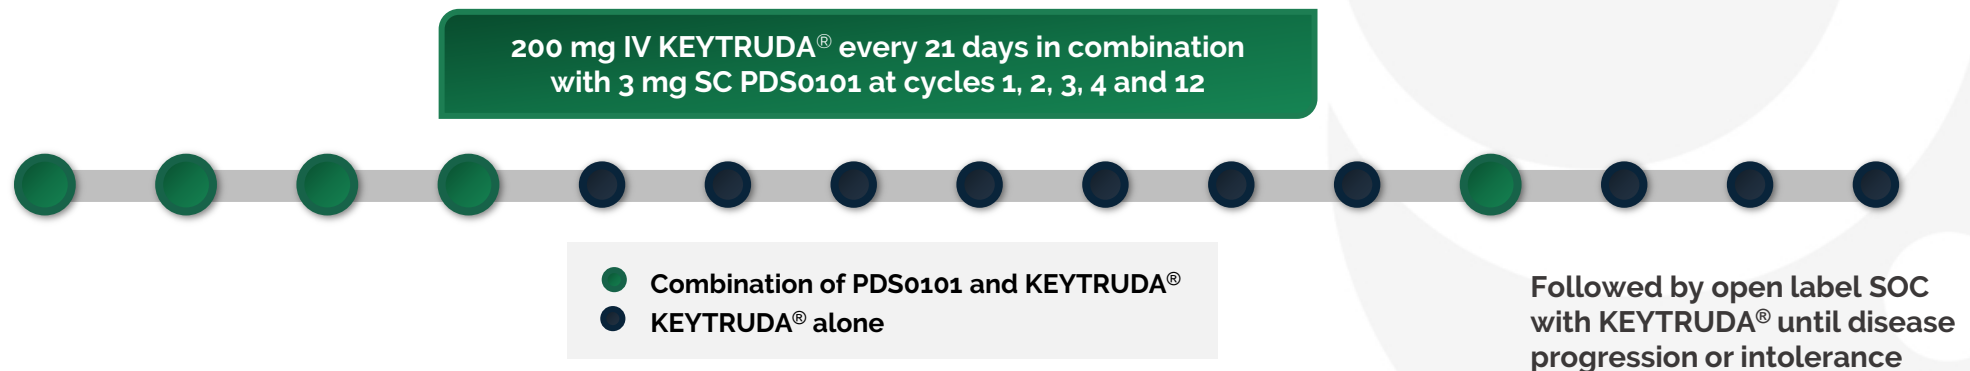

PDS0101 is the only compound selected by Merck for evaluation in combination with KEYTRUDA® as first line cancer therapy

- PDS0101 + KEYTRUDA®
 - Keytruda® first immunotherapy approved as standard of care for first line treatment of cancer (recurrent or metastatic head and neck cancer)
 - PDS0101 first T-cell activating immunotherapy to demonstrate both high levels of circulating CD8+ killer T-cells and therapeutic benefit as monotherapy
 - Unique immuno-oncology combination addressing first-line treatment of cancer
 - Validation of both efficacy and safety of PDS0101
 - ***Anticipated advantages of combining PDS0101 with standard of care:***
 - Mitigated risk
 - Potential enhanced rates of recruitment
 - Potential for rapid market penetration and market leadership

Initiation TBD pending easing of COVID-19 restrictions

A Phase 2 study of PDS0101 in combination with KEYTRUDA® in first-line treatment of recurrent/metastatic head and neck cancer is planned

- PDS Biotechnology-sponsored study with KEYTRUDA® supplied by Merck
- Primary endpoints: Efficacy, safety and tolerability
- Study design: Phase 2 open-label study
- Inclusion criteria: Recurrent/metastatic head and neck cancer and HPV16 infection
- Clinical Trial Identifier: NCT04260126

- Expected initiation: TBD pending easing of COVID-19 restrictions

Investigator-Led Phase 2 studies of PDS0101 in combination therapy will evaluate efficacy and safety in treatment of advanced HPV cancers

Funded By	Phase 2 Open Label Study (Safety and Efficacy)	Important Considerations	Expected Initiation
	<ul style="list-style-type: none"> Advanced HPV-associated malignancies – all types Triple combination with EMD Serono’s M7824 and NHS-IL12 34 subjects Clinical Trial Identifier: NCT04287868 	<ul style="list-style-type: none"> NCI selection and confirmation of synergies with PDS0101 All three agents have demonstrated efficacy as monotherapies in early trials 	<p>TBD pending easing of COVID-19 restrictions</p>
	<ul style="list-style-type: none"> Advanced, localized cervical cancer (Stage IIb-IVa) Combination with chemo-radiotherapy (CRT-standard of care) 35 subjects 	<ul style="list-style-type: none"> T-cell induction has strong potential to enhance CRT anti-cancer efficacy Mitigated risk Potential for rapid market penetration and market leadership 	<p>TBD pending easing of COVID-19 restrictions</p>

A 3D rendering of a large, spherical virus particle with a textured surface and several smaller virus particles floating around it. The large virus is light blue and has a complex, multi-lobed structure. The smaller viruses are dark blue and have a similar but simpler structure. The background is a dark, gradient blue.

Infectious Disease

PDS Biotech's infectious disease pipeline combines the Versamune[®] platform with proprietary tumor antigens across several diseases

PRODUCT	INDICATION	COMBINATION	PC	P1	P2	P3	R	PARTNER(S)
Infectious Disease								
<u>PDS0201</u> <u>(M-tuberculosis)</u>	Prevention of tuberculosis							
<u>PDS0202</u> <u>(influenza)</u>	Universal prevention of influenza							
<u>PDS0203</u> <u>(SARS-CoV-2)</u>	Prevention of COVID-19							

PDS Biotech Funded  Partner Co-Funded 

Versamune[®] dramatically enhances induction of neutralizing antibodies against various influenza strains and enables significant dose sparing

The addition of Versamune[®] to Fluzone[®], a seasonal influenza vaccine, resulted in a 40-fold increase in protective HAI titers – achieving superior levels of HAI titers with 5-fold lower doses of Fluzone[®]

Versamune[®]-based vaccines uniquely induce strong antibody, helper and killer T-cell responses against an antigen to provide superior protection

Versamune[®] uniquely induces both potent antibody mediated responses and high levels of helper and killer T-cells vs. CFA when both are administered with the same recombinant protein antigen

Preclinical testing of PDS Biotech's Versamune[®]-based COVID-19 vaccine candidates are underway with a clear target profile

1

Induction of highly-potent, SARS-CoV-2-specific killer T-cells

2

Demonstrate high levels of both SARS-CoV-2-specific T-cell and antibody response after a single dose

3

No safety signals

4

Poised for rapid commercial scale up

Intellectual Property and Financials

Multiple layers of technology and product protection for Versamune®-related products through mid-2030s are secured

- Versamune® and associated patents are owned and licensed by PDS Biotech
- Patents cover methods and compositions stimulating/promoting an immune response with Versamune® technology in various forms and mechanisms through 2034
 - Use of specific cationic lipids to induce an immune response
 - Compositions and use of any cationic lipid to activate MAP kinase
 - Compositions and use of R-DOTAP to induce immune response
 - Micellar antigen + cationic lipids compositions (US still ongoing)
 - Compositions of R-DOTAP with GM-CSF to reduce immune suppressive myeloid derived suppressor cells in the tumor
- Five issued international patent families (including Europe and Japan)

PDS Biotech is in a strong financial position to support near-term milestones

Timing of the 2020 milestones will be impacted by the COVID-19 pandemic
